

Hope Artificial Intelligence

Scenario Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

B) Find out the 3 -Stage of Problem Identification

C) Name the project

D) Create the dummy Dataset.

A) How will you achieve this in AI?

End goal of this project is to **predict the employee who resign next**. We will have input of the employee and output is percentage of chance of the employee resign.

B) Find out the 3 -Stage of Problem Identification

Stage 1: Machine Learning—Because the inputs are Salary, Increment Percentage and hike. All values are numbers.

Stage 2: Semi Supervised Learning-Because my requirement is to predict who is resigning next. Hence, Requirement is clear. Next, we have Inputs and we need to identify the percentage of chance to resign (output data).

Stage 3: Regression- We need to identify the percentage of chance of the employee's resign based on the input.

C) Name the project- Employee Resignation Prediction

D) Create the dummy Dataset.

Employee Name	Employee current salary	Employee Rating 1-Excellent 2-Proficient 3-Met Expectation 4-Need to improve	Increment of this year	After increment	Percentage of Chance to Resign
Ramesh	10000	2	15%	11500	70%
Suresh	20000	4	0%	20000	99%
Sangeetha	5000	3	5%	5250	90%
Raju	15000	1	20%	18000	50%
